

# INDOOR POLLUTANTS

“Every building, irrespective of its construction, contains within its materials a level of microbial spores, which in well balanced environment would lay dormant or co-exist with their habitat in innocuous levels.

**Indoor Air Quality (IAQ)** is very important to the balance of the indoor environment. No other ‘Pollutant’ has the combined impact to reduce human quality of life and cause damage to buildings as do air borne microorganisms. Every building, irrespective of its construction, contains within its materials a level of microbial spores, which in well balanced environment would lay dormant or co-exist with their habitat in innocuous levels. These microorganisms will live happily, silently and unnoticed. However, given the right conditions these spores will germinate resulting in extensive growth and will start to cause problems.

IAQ Consultants are engaged in the execution of indoor testing services and their remediation to control the growth of such organisms in buildings and prevent health complaints. Biological and chemical contamination can be present all types of buildings including new commercial buildings, potential green buildings, domestic dwellings and industrial premises. Cleverly, contamination does not present it’s self until it is present is extremely large levels which can cause some very unpleasant working conditions for occupants.

**Get your indoor space tested and cured today, to ensure a safe indoor environment for your staff or family. Visit [www.iaqsg.com](http://www.iaqsg.com) for more information.**
